## HP5000® High & Low Pressure Ducting

- Diesel Generators & Turbines
- Boilers (High & Low Temperature)
- Kitchen Extraction
- Smoke & Waste Gas Extraction
- Refuse & Laundry Chutes
- Service Trunking
- Lightweight Particle Movement

CE

  
**MONIER**

# Application

An engineered multi purpose prefabricated ducting system suitable for high or low temperatures and fire rated applications.

HP5000® is a lightweight twin wall insulated and single wall duct system specifically designed to handle both pressure and non pressurised applications. As outlined in the product's CE designation, the system is designed to operate under pressure up to 5000Pa (European Standard Designation H1) and with continuous operating flue gas temperatures up to 600°C (European Standard Designation T600).

The system is tested for Thermal Shock at 1000°C.

HP5000® has an extensive range of twin and single wall components with 25mm and 50mm cavity insulation or air gap insulation, giving it the versatility required to meet the widest range of applications. It can be used internally and externally.

## A typical range of applications would include:

- Diesel generators and turbines
- Boilers (high or low temperature)
- Kitchen extraction
- Smoke and waste extraction
- Refuse and laundry chutes
- Lightweight particle movement

# Product Description

## **The Twin Wall System consists of:**

Inner Liner 316L Stainless Steel; seam welded continuous construction with an engineered flange at each end. Available in 0.6mm and 1mm inner liner thickness.

Internal Diameters: 130, 150, 180, 200, 230, 250, 300, 350, 400, 450, 500, 550, 600, 650, 700, 750 & 800mm.

The 0.6mm option is available for diameters from 130 to 350mm.

25mm or 50mm cavity filled with a mineral fibre insulating blanket.  
(50mm cavity insulation is only available up to 750mm internal diameter.)

Outer casing 304 stainless steel; 0.6mm for 130 to 550mm diameters and 0.7mm for 600 to 800mm diameters.

The specially designed joint between the components creates a pressure resistant and structural liner.

## **Forming the joint**

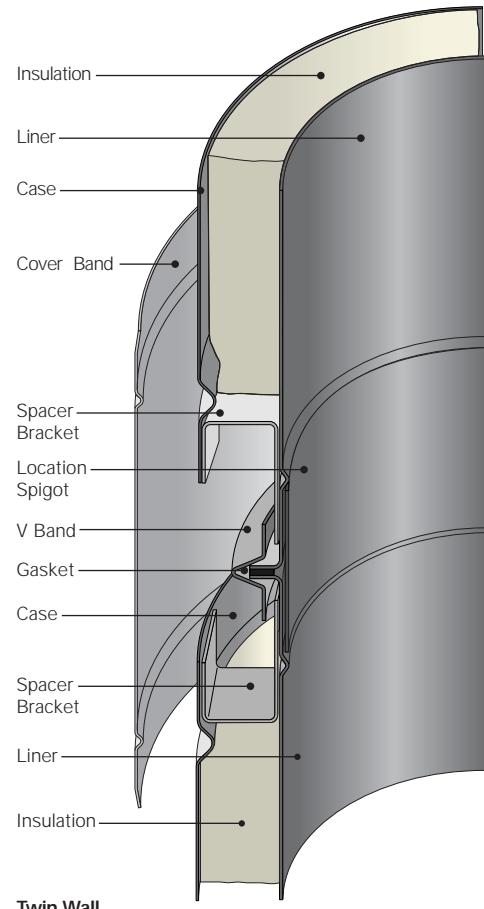

The components are flanged at both ends with a spigot at the male end. The spigot protrudes by 25mm to ensure correct alignment of the joint and seating of the gasket on the engineered flanges.

A gasket is pre-installed on the male end of the component for ease of installation.

When two components are butted together the joint is secured using a V Band.

No sealants are required as the joints come with a pre-installed gasket.

All male flanged components come complete with gasket (pre-fitted), V Band, insulation and Cover Band.

### The Single Wall System consists of:

316L Stainless Steel; seam welded continuous construction with an engineered flange at each end.  
Available in 0.6mm and 1mm wall thickness.

The 0.6mm option is available for diameters from 130 to 350mm.

Internal Diameters: 130, 150, 180, 200, 230, 250, 300, 350, 400, 450, 500, 550, 600, 650, 700, 750 & 800mm.

The specially designed joint between the components creates a pressure resistant and structural liner.

### Forming the joint

The components are flanged at both ends with a spigot at the male end. The spigot protrudes by 25mm to ensure correct alignment of the joint and seating of the gasket on the engineered flanges.

A gasket is pre-installed on the male end of the component for ease of installation.

When two components are butted together the joint is secured using a V Band.

No sealants are required as the joints come with a pre-installed gasket.

All male flanged components come complete with gasket (pre-fitted) and V Band.

### Expansion Allowance

As the method of assembly for HP5000® provides a continuous structural inner wall, normal expansion of the duct in its entirety must be allowed for by the use of expansion components. (see page 22 & 23)

### Performance

Working pressure:

With Expansion Lengths up to 40Pa

With Expansion Bellows up to 5000Pa

Maximum Temperature Rating: continuous 600°C (European Standard Designation T600)

HP5000® is available in a range of 17 internal diameters from 130mm to 800mm. The flange to flange installed straight lengths are 307, 470 and 960mm long. The external diameter is dependent on the width of the cavity – 25mm or 50mm. Specialised components can be manufactured to suit application requirements.

### Supports

HP5000® must be supported using only Schiedel Rite-Vent approved components, in conjunction with suitable steel work as necessary. Care is needed to ensure that supports are capable of accommodating expansion.

## Approvals

HP5000® is manufactured under a Quality Assurance Scheme, Certificate No. FM 25918, administered by British Standards in accordance with: BS EN ISO 9001 -2008;

The Twin Wall product is tested and approved to EN 1856-1 with the following CE Designations. **Cert. No. 0036 CPD 9191026**

25mm Cavity

**T600 H1 WV2 L50100 G75**

**T600 H1 WV2 L50060 G75**

50mm Cavity

**T600 H1 WV2 L50060 G50**

**T600 H1 WV2 L50100 G50**

The Single Wall product is tested and approved to EN 1856-2 with the following CE Designations. **Cert. No. 0036 CPD 9195028**

**T600 H1 WV2 L50100 G500**

**T600 H1 WV2 L50060 G500**

## Fire Rating

HP5000® has been independently certified and has achieved a 4 hour fire rating in accordance with BS476 Part 20.

## Design Services

Schiedel Rite-Vent can offer a complete design and installation service. Schiedel Rite-Vent employs a policy to ensure continued improvements and reserve the right to make changes and improvements without prior notice.

## Installation Guidance

Notes on the key components and examples of installation configurations are included in later sections of this document.

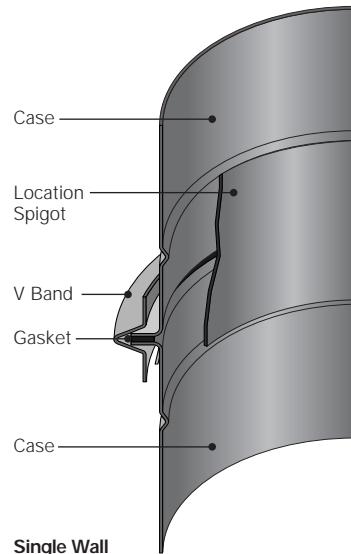

The on-site handling and storage is also important and thought should be given to this before delivery of the product.

One of the reasons for choosing 316L grade stainless steel for the inner liner is its corrosion resistant properties. However certain chemicals and in particular those containing derivatives of chlorine or halogen can attack stainless steel and cause premature product deterioration.

Consideration should be given to the chemical composition of the exhaust gases. This also includes any chemicals that could enter with the combustion or process air.

Examples of such substances include chlorine, chlorinated or halogenated dry cleaning and metal cleaning solvents; fluorocarbon refrigerants and aerosols; acids and in particular hydrochloric and sulphuric acids; bleach and cleaning solutions; plating and etching solutions; titanium tetrachloride.

The use or storage of such chemicals, in the vicinity of the installation can also lead to contamination.

## PRODUCT INFORMATION

### Joint Assembly

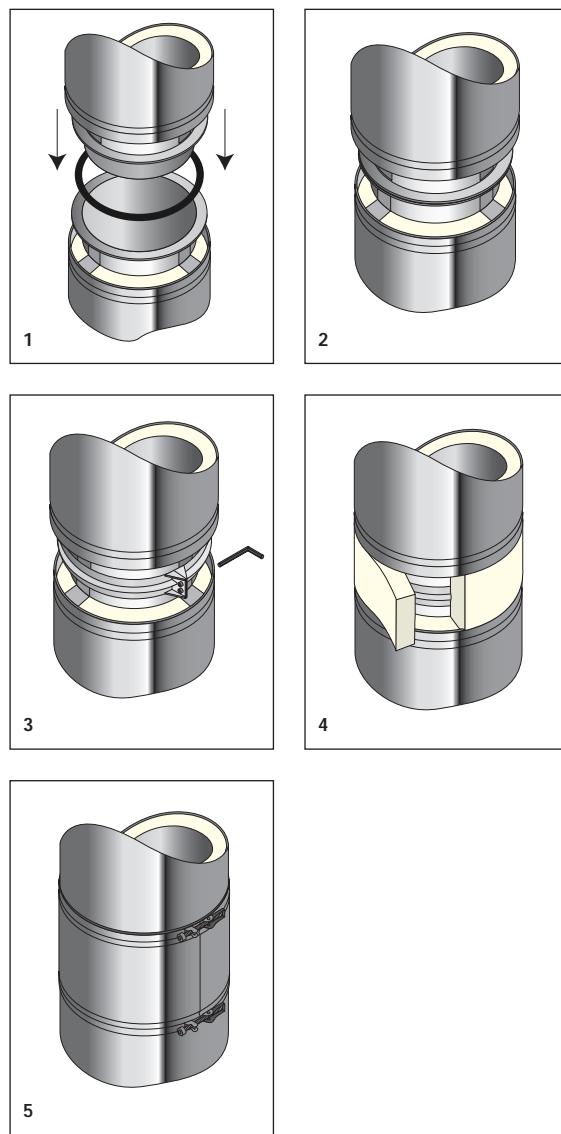

Flange to flange joints are assembled as follows.

1. Check that the flanges are not damaged and are free from grit, grease and other contaminants.
2. Align the parallel flanges of the two components making sure that the flanges are correctly seated. The male spigot must be pointing towards the heat source.
3. Loosely connect the male to female ends at one half of the V Band with the nut and bolts. Position the V band over the butted flanges and tightly clamp both joints using the nuts and bolts provided. (Note that the integrity of the joint between components is dependent upon the correct tightening of the V band. Tap V band on all sides with a soft mallet to ensure correct seating). Do not allow screws or bolts to penetrate the inner liner or outer skin at any point. On horizontal runs, locate the securing nut and bolt joints on either side of the duct; not top and bottom.
4. Place the insulation supplied in the space between the components, being careful to wrap it completely around the joint.
5. Locate the cover band over the joint so that the beads sit in the grooves and secure using the clips. The cover bands are designed to slide in their mating grooves to allow for expansion.

For outdoor installation, apply a bead of low temperature sealant in the groove at the upper edge of the cover band.

#### Low Temperature Sealant

Sealant is only needed on external applications to prevent water penetration of joint.

### Thermal Expansion

Thermal expansion must be allowed for in the design of the system. The inner wall and outer casing can expand at different rates. As the inner liner forms a continuous pipe, specially designed expansion components need to be incorporated to compensate for thermal expansion. Expansion bellows should be added when the expansion exceeds 6mm.

When it comes to the outer casing, floor and wall guides must be located to allow for the movement of any adjacent cover bands. Guide Band assemblies will give adequate support and allow for thermal movement.

Expansion of the HP5000® can be calculated on the basis that there will be 1mm of liner expansion per metre for each 50°C rise of gas temperature above ambient temperature. Alternatively the formula below can be used to determine the expansion required.

$$\Delta t \text{ (Expansion to be allowed for in mm)} = (\text{meter run}) \times (\text{flue gas temperature above ambient temp } ^\circ\text{C}) / 50$$

So for example, a 20 metre run of HP5000® subjected to a flue gas temperature of 300°C above ambient will need to accommodate an expansion of 120mm ( $20 \times 300 / 50$ )

With kitchen extraction ducts, always assume a temperature of 1000°C to cater for the expansion resulting from a grease duct fire.

The table below shows the overall thermal expansion

		Thermal Expansion (mm)																														
		1000	10	20	30	40	50	60	70	80	90	100	110	120	130	140	150	160	170	180	190	200	210	220	230	240	250	260	270	280	290	300

Overall Installed Length (Metres)

## Lined Expansion Bellows

Expansion bellows are designed to allow the systems with a pressure above 40 Pa to expand and contract under thermal load. The bellows are designed to accommodate a system pressure of 5000 Pa.

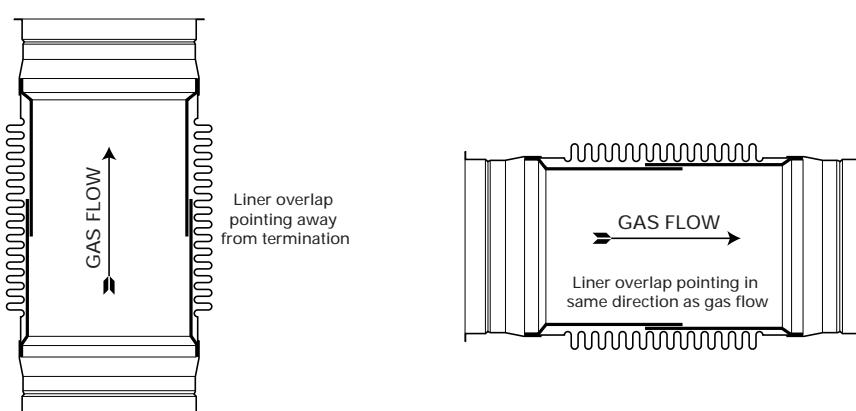

Bellows must always be supported and guided. When installed between two fixed points, the bellows should be installed near the support furthest away from the appliance or heat source. To ensure axial alignment, lateral bracing support assemblies must be fitted close to and upstream of the Bellows. Do not locate a Bellows adjacent to an Elbow or fitting as the liner movement could be impeded. Bellows can handle axial and vibration movements but not lateral movement. Lateral offset and parallel misalignment should be eliminated.

**Vertical installations:** This prevents water and dirt becoming trapped between it and the bellows. The support guides can inhibit thermal movement and must be placed accordingly.

**Horizontal installations:** Care must be taken not to pre-stress or compress the bellows during installation.

**Expansion Bellows allow for a maximum expansion of 100mm/bellow.**

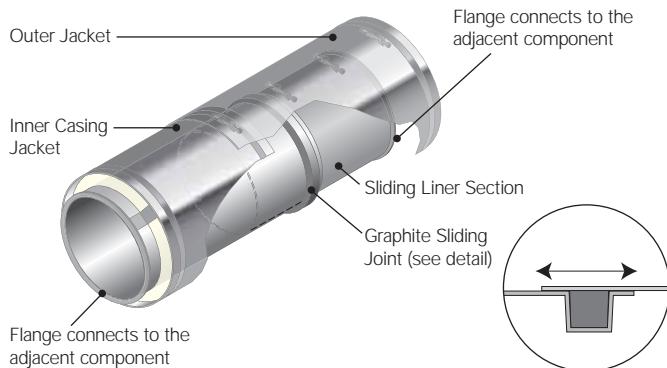

Vertical installation

Horizontal installation

## Expansion Pipe

The expansion pipe comprises a sliding inner section, flanged at one end only. This sliding section is sized to fit closely inside the 500mm length (supplied). A graphite seal, insulation and outer jacket are supplied with this component.

**This component is not load bearing and can only accommodate a maximum pressure of 40Pa.**

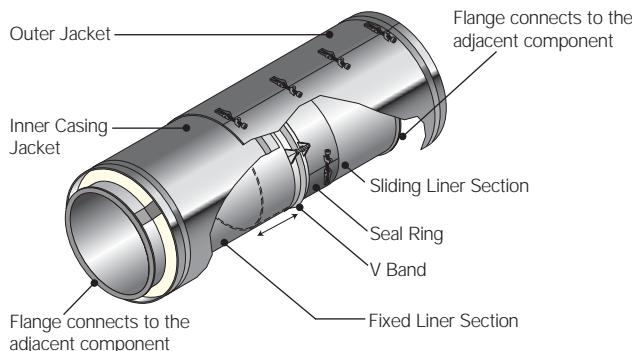

1. Fit the pipe to the duct system.
2. Ensure the sliding flange is in place and slide into the pipe length supplied.
3. Once installed to the desired length wrap the insulation around the sliding flange.
4. Fit the outer jacket.

## Adjustable Length

The adjustable length comprises a sliding inner section, flanged at one end only. This sliding section is sized to fit closely inside the 500mm length (supplied). A sliding flange and cover band is supplied with the adjustable liner. The component also comes with insulation and an outer jacket that can fit across the desired length. When fixed the length cannot be adjusted.

**This component is not load bearing and must not be used to accommodate thermal expansion.**

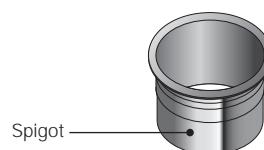

1. Fit the pipe to the duct system.
2. Ensure the sliding flange is in place and slide adjustable pipe length into standard pipe length.
3. When the desired length is achieved clamp the flanged joint as per standard instructions.
4. Apply high temperature sealant behind the sliding section.
5. Fit the seal ring over the sealed joint and secure using the clip.
6. Apply high temperature sealant around the seal ring.
7. Wrap open liner with insulation and fit outer jacket.

## Appliance Connector

The standard appliance connector is 150mm long and flanged at one end only.

Fit the protruding spigot to the appliance as required.

## Bends and Offsets

Bends are designed to allow changes in direction through 15°, 30°, 45°, 85° and 90°. They must be protected from thermal expansion and bending forces. Offsets of different lengths are achieved by adding straight lengths. For offset lengths see table on page 25.

Sloped or horizontal offsets in the vertical portion of a duct above the breaching should be avoided except where absolutely necessary. Sloped offsets require more expansion joints and secure bracing above and below bends. It is essential that an adequate number of supports are used at close intervals. Additional support can be provided by using an additional support plate located at the other end of the bend, or fitting and bolting lateral braces across the corners using angle iron bracing (example on page 25).

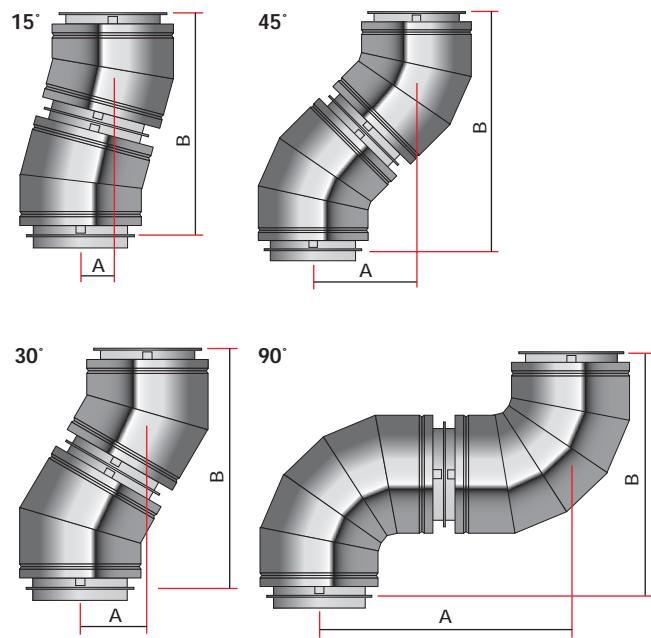

The length of an offset is determined by the ability to support the weight of the system. The maximum length between bends is 4 meters. The maximum height above the last point of lateral support is 3 meters. With frequent support, there is no structural or operating limit to the distance covered by an offset provided the system meets the capacity, pressure drop and available draught requirements of the appliance.

The ends of any sloped or horizontal offset must be anchored to prevent over-stressing the bends, and to ensure proper operation of expansion joints. The vertical section of duct above the offset must also be supported or anchored, and guided where necessary. Supports suspended by threaded rods or from small sized angle bars or straps are not satisfactory to resist bending moments in the offsets.

## Offset Dimensions

Dia.	15° Offset		30° Offset		45° Offset		90° Offset	
	A	B	A	B	A	B	A	B

## Support Plate Assembly

The Support Plate Assembly is designed to brace and support a vertical flue or duct and to maintain positive joint alignment and support for expansion joints. In both horizontal and vertical applications. Structural ties should be used to support plates to the building. This may require supports both upstream and downstream of a tee, which would then be protected from excessive expansion stresses. (If the support plate is not supplied by Schiedel Rite-Vent we can not guarantee the system)

See the table weights of lengths and support components on page 30.

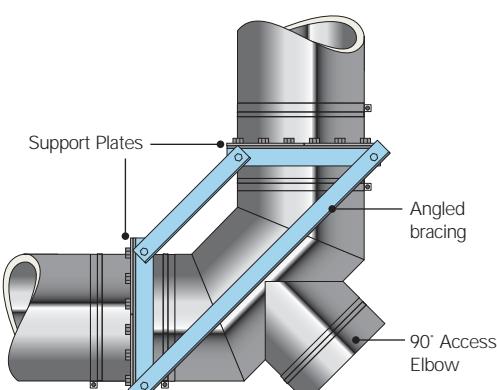

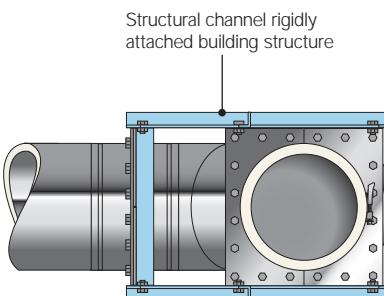

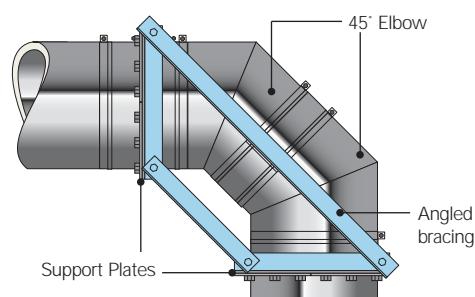

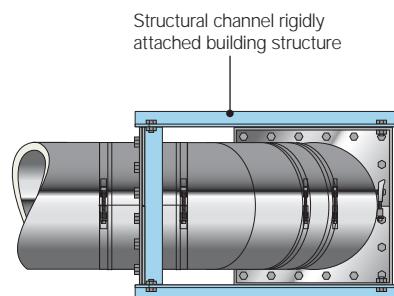

The Support Plate Assembly consists of an installed length of liner flanged at both ends, and with a centrally located inner welded flange. Pairs of plates (4 plates in total) are assembled with half sections aligned at 90° to each other. The plates are located on each side of a central flange. The plates are secured with bolts to adjacent steel framework.

**Typical boiler installation**

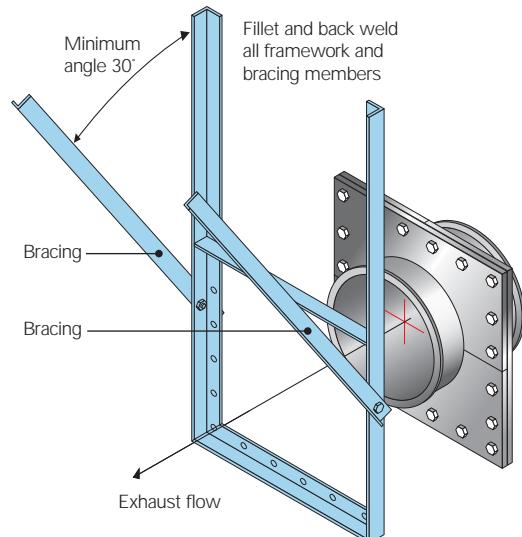

Structural members by others to suit load and building design

**Typical bracing of elbows**

## Recommended Framework and Bracing Dimensions

Size	Framework (minimum dimensions)	Bracing (minimum dimensions)
130 - 550mm	50 x 25 x 5mm	50 x 50 x 5mm
600 - 800mm	125 x 45 x 6mm	75 x 75 x 6mm

All structural channels and members supplied by client.

## Wall Support Assembly

There are 2 versions to cover internal diameters 130mm to 650mm and 700 to 800mm.

**130mm to 650mm:** The support plates have one set with flanged edges, a pair of triangular side plates and a 170mm integral length with a central flange.

**700mm to 800mm:** The support plates have a pair of steel triangular side frames, two cross members, two spacers and the integral 230mm length.

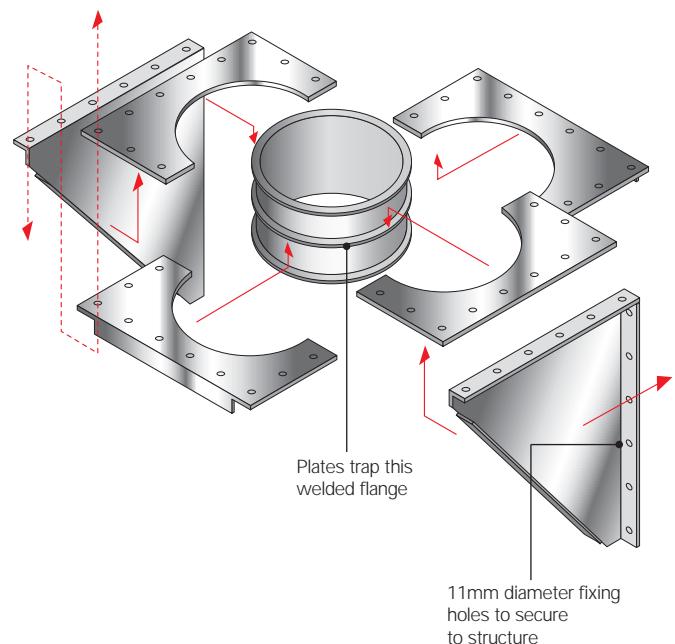

On both versions the side support must be orientated so that they are on the load bearing side of the encased welded liner joint.

The load bearing on the system can be mechanical (weight) or thermal (expansion) or both. The greater of these forces will determine the orientation of the construction. The support assembly must be tightly bolted using all the nuts and bolts provided.

The Wall Support forms a fixed point in the system so expansion movement must be allowed for during system design. As the Wall Support interrupts the annulus of the HP5000® construction, a Cover Jacket Set should be used to close the annulus on each side of the Plate Joint.

With freestanding chimneys the wall support can be used up to the point where a chimney becomes freestanding. A wall guide should be installed 2 - 3 meters below the wall support to stabilise the exposed end against wind loading. See the table weights of lengths and support components on page 30.

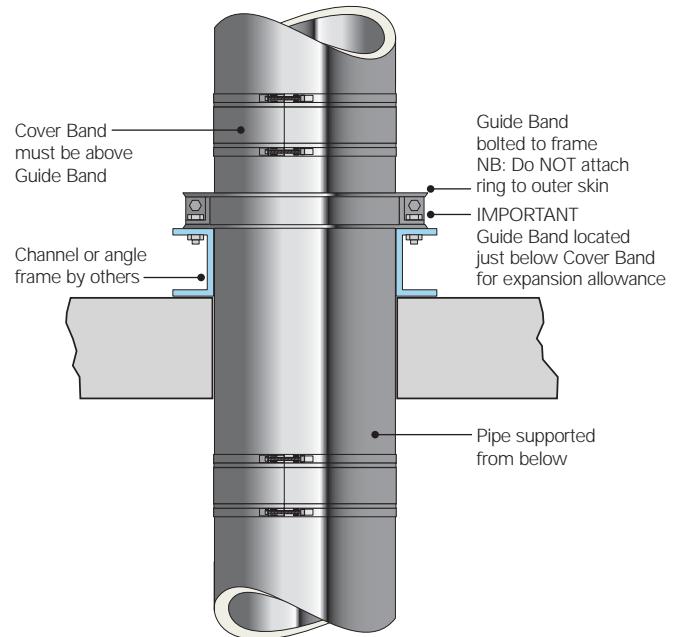

When attached to a masonry wall or suitable non-combustible structure the Wall Support must be secured with adequate fixings.

## Guide Band and Support Cradle

The guide band is used as an expansion guide.

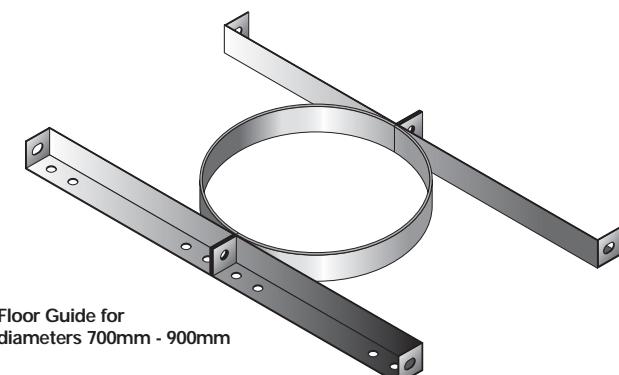

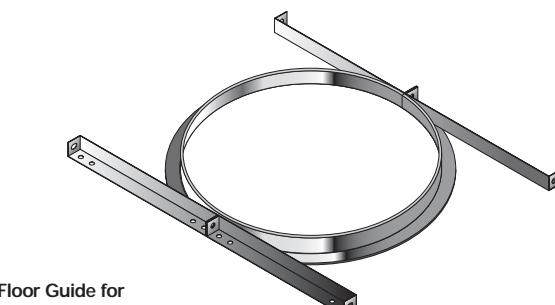

For horizontal applications, either a Guide Band or a Support Cradle may be suspended by rods or other types of rigid brace. The guide band inside diameter is 5mm larger than the outside diameter of the liner to allow for sliding movement during thermal expansion.

## Floor Guide

This consists of a guide band, four short angle sections and associated nuts and bolts. The guide band inside diameter is 5mm larger than the outside diameter of the liner to allow for sliding movement during thermal expansion.

Bands: Stainless steel  
Angle Sections: Painted steel

## Wall Guide

There are 2 versions to cover internal diameters 130mm to 650mm and 700mm to 800mm.

The guide band inside diameter is 5mm larger than the outside diameter of the casing to allow for sliding movement during thermal expansion.

Both versions are designed to provide 55mm clearance from the outer casing of HP5000® to a non-combustible structure only. The assembly is intended to resist lateral movement and is not weight bearing.

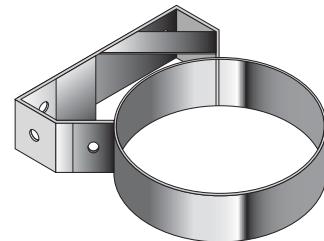

The wall guide consists of a guide band, bracket and nuts and bolts for assembly but not the fixings for attachment to the structure. These must be provided by the installer and should be of sufficient and suitable strength to ensure adequate attachment.

If the system must be attached to a combustible wall spacers should be used to maintain the minimum clearance required and minimise heat conduction through supporting metal parts. The minimum distance to combustibles for 25mm cavity is 75mm and 50mm for 50mm cavity. See CE designations.

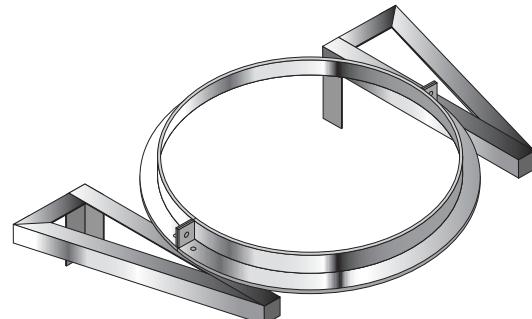

Wall Guides should be installed at a maximum distance of 4 metre centres.

Bands: Stainless steel

Angle Sections: Painted steel

Wall Guide for external  
diameters 130mm - 650mm

Wall Guide for external  
diameters 700mm - 900mm

## 90° and 95° Tees

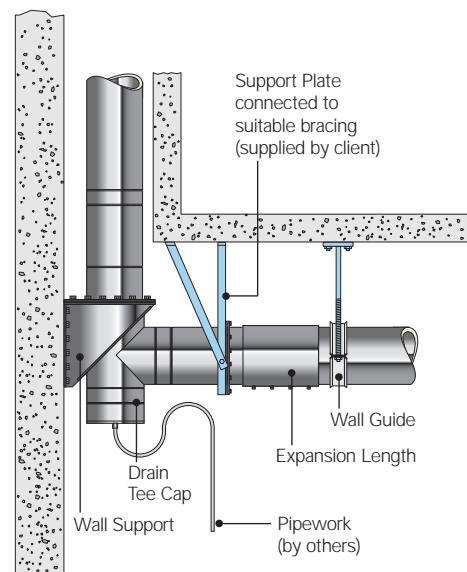

90° and 95° tees are designed to move the duct through 90° and 95° from the horizontal to the vertical and provide a drain or inspection point. When used as a drain the drain tee cap is installed at the base of the tee and piped to a suitable drain as required.

If the drain cap is used on a pressure system a trap is required to accommodate the pressure.

If placed on top of a supporting framework or flat plate, the tee cap closure becomes inaccessible and cannot be removed. Access can be achieved in one of two ways:

1. Use a Support Plate or wall support at the upper tee joint, as shown.
2. Support the tee from its lower joint with a support plate or wall support and use an additional 500mm standard pipe length below the support beneath which a drain tee cap can be located.

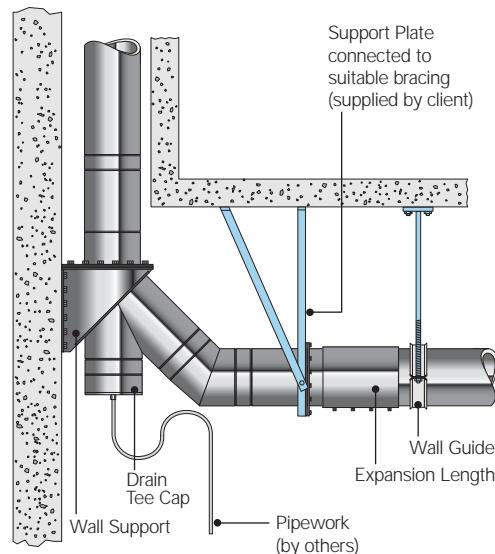

All tees must be protected from expansion greater than 6mm.

## 135° Tee

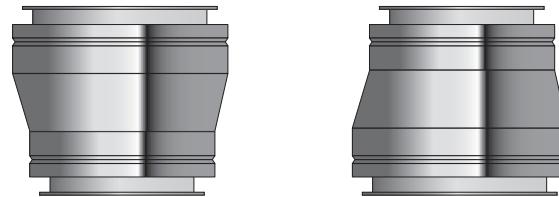

The 135° tee allows a 45° entry to the vertical duct and provides a drain or inspection fitting. When used as a drain the drain tee cap is installed at the base of the tee and piped to a suitable drain as required. In a horizontal breaching configuration use of a 135° tee necessitates the use of a 45° elbow. If the drain cap is used on a pressure system a trap is required to accommodate the pressure.

All tees must be protected from expansion greater than 6mm.

## Increases/Decreases

Tapered increases and decreases provide for changes in diameter and have an installed length of 307mm.

## Applications

### Smoke Extraction

HP5000® can be used as the duct for mechanical smoke extraction systems. The light weight, modular components simplify insulation and the circular pipes require a smaller cross sectional area than square ducting. Circular pipes are also more efficient than square ducts for moving high volumes of air. Twin & single wall can be used.

### Process & Waste Gas Extraction

HP5000® can be used with both diesel generators & boilers in low and high pressure situations. It is ideal for both condensing and semi-condensing boilers. The fact that it is pressure resistant means that the duct diameter can be reduced (subject to allowable back pressures on the appliance). The duct is suitable for all fuels.

From an installation point of view the big benefit is that on-site welding is not required.

Twin wall ducting should be used.

### Kitchen Extraction

The HP5000® can be used to extract fumes from commercial kitchen fat fryers and open cooking equipment. The potential danger with these fumes is that they can condense leaving fatty deposits that can ignite. The Schiedel HP5000® is able to withstand temperatures up to 1000°C. Twin wall ducting should be used.

### Lightweight Particle Movement

The HP5000® can be used to extract lightweight dust particles and other particles in a wide variety of substances on industries as diverse as the chemical industry and agriculture.

HP5000® bends have flanges for ease of replacement should wear and tear become an issue.

Single wall installations are more common. Twin wall should be used where the temperature of the particles is a consideration and heat loss needs to be minimised.

### Service Trunking

The highly insulated nature of the HP5000® makes it ideal to protect important cables & wires. Access points can be added as required. The light weigh, modular components simplify insulation and the circular pipes require a smaller cross sectional area than square ducting. Twin wall ducting should be used.

### Refuse & Laundry Chutes

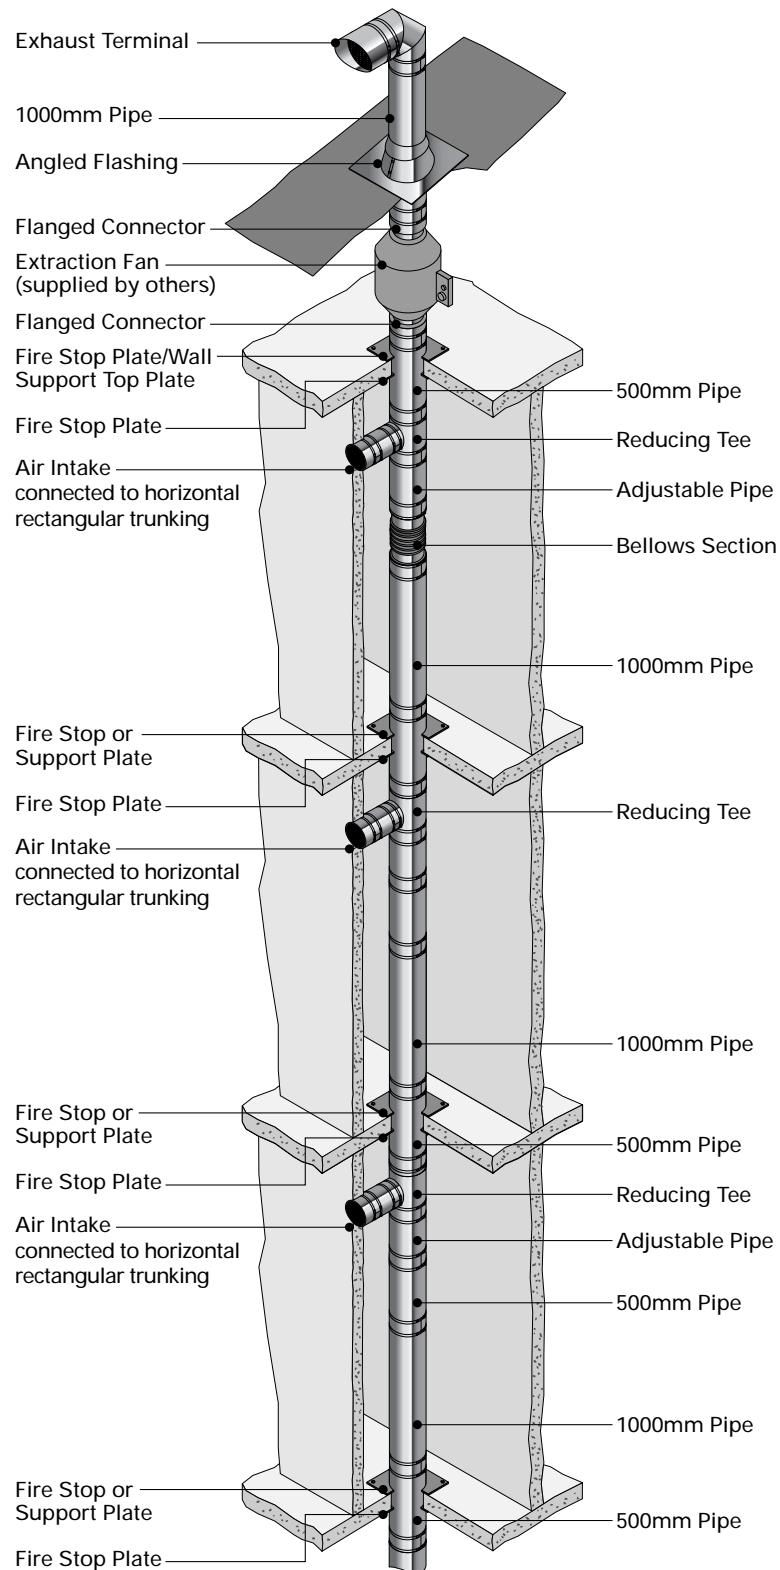

Two of the key points in the design of Refuse & Laundry Chutes are that they should be water tight and the inner surface should have a low friction coefficient. The HP5000® scores well on both points.

Single skin is generally applicable but twin wall should be used when sound proofing is required.

### Key Benefits

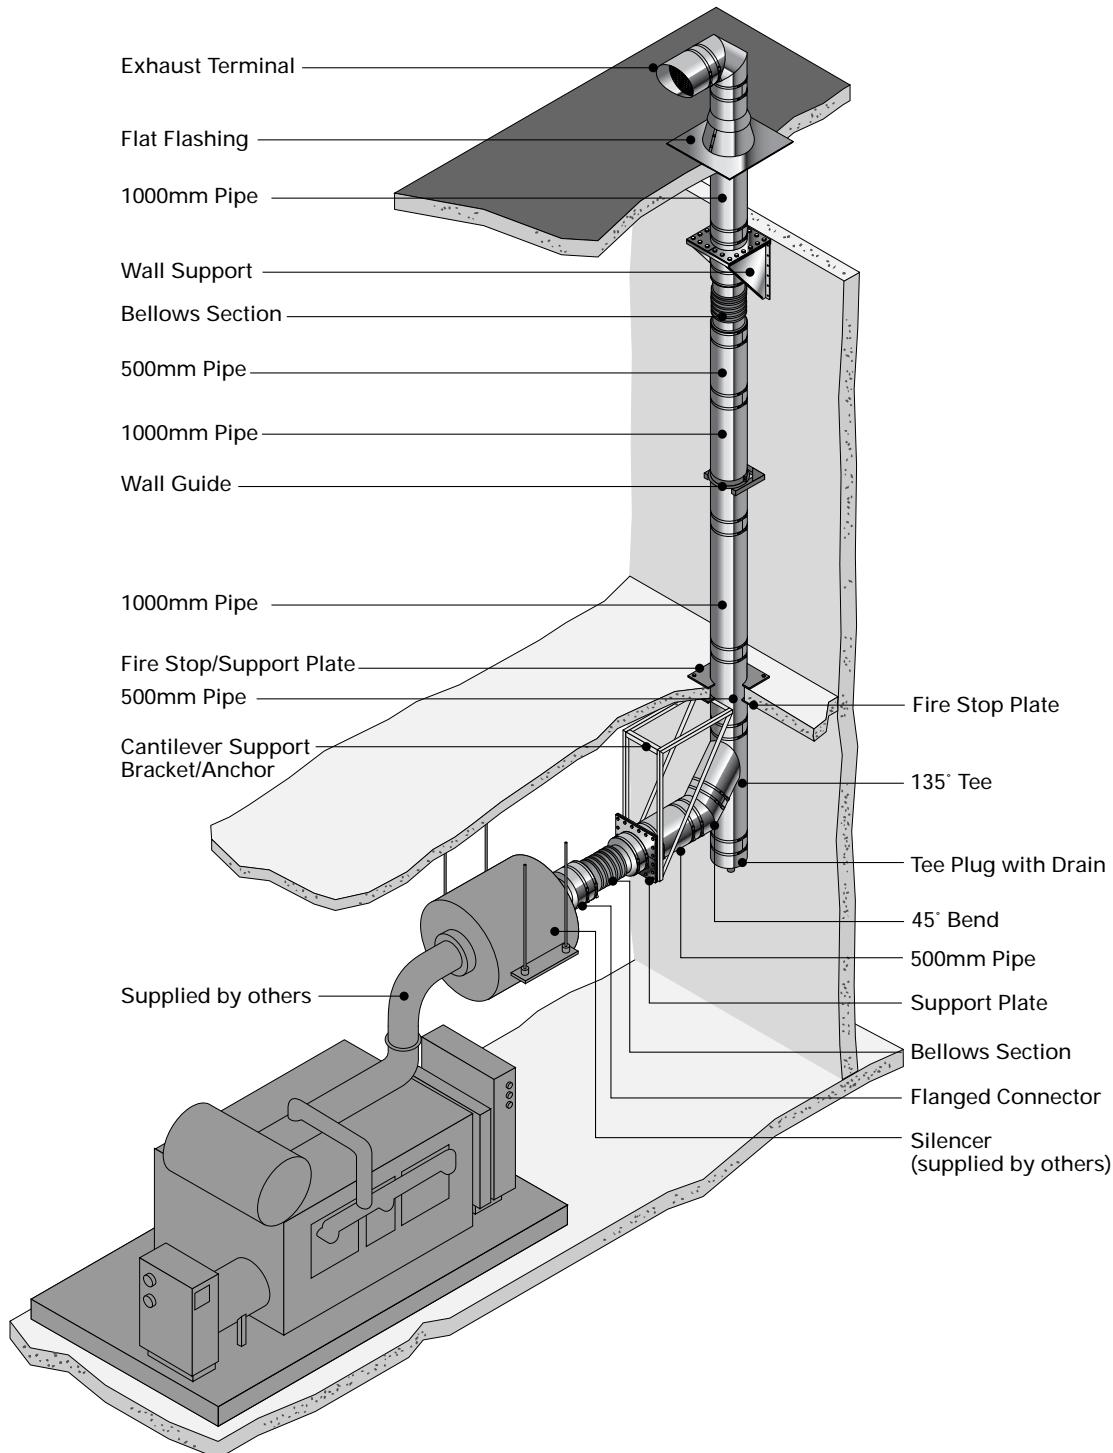

- Multi-purpose, High Temperature, Pressure Resistant Ducting.
- Temperatures up to 600°C on constant firing, tested to 1000°C.
- 17 Diameters from 130mm to 800mm.
- Inner liner 0.6mm, grade 316L stainless steel option for 130mm to 350mm diameters or 1mm inner liner for all diameters.
- Outer casing stainless steel grade 304, diameters 130 - 550mm 0.6mm, 600 to 800mm 0.7mm.
- Available in 25mm or 50 insulation.
- Lightweight approx. 1/4 of the weight of mild steel.
- Pressure resistant to 5000Pa.
- Moisture tight.
- Bends the can be replaced.
- No welding on site.
- No staining of building (rust) on high temperature applications.
- Speed of installation.

## HP5000 Applications - Smoke Extraction

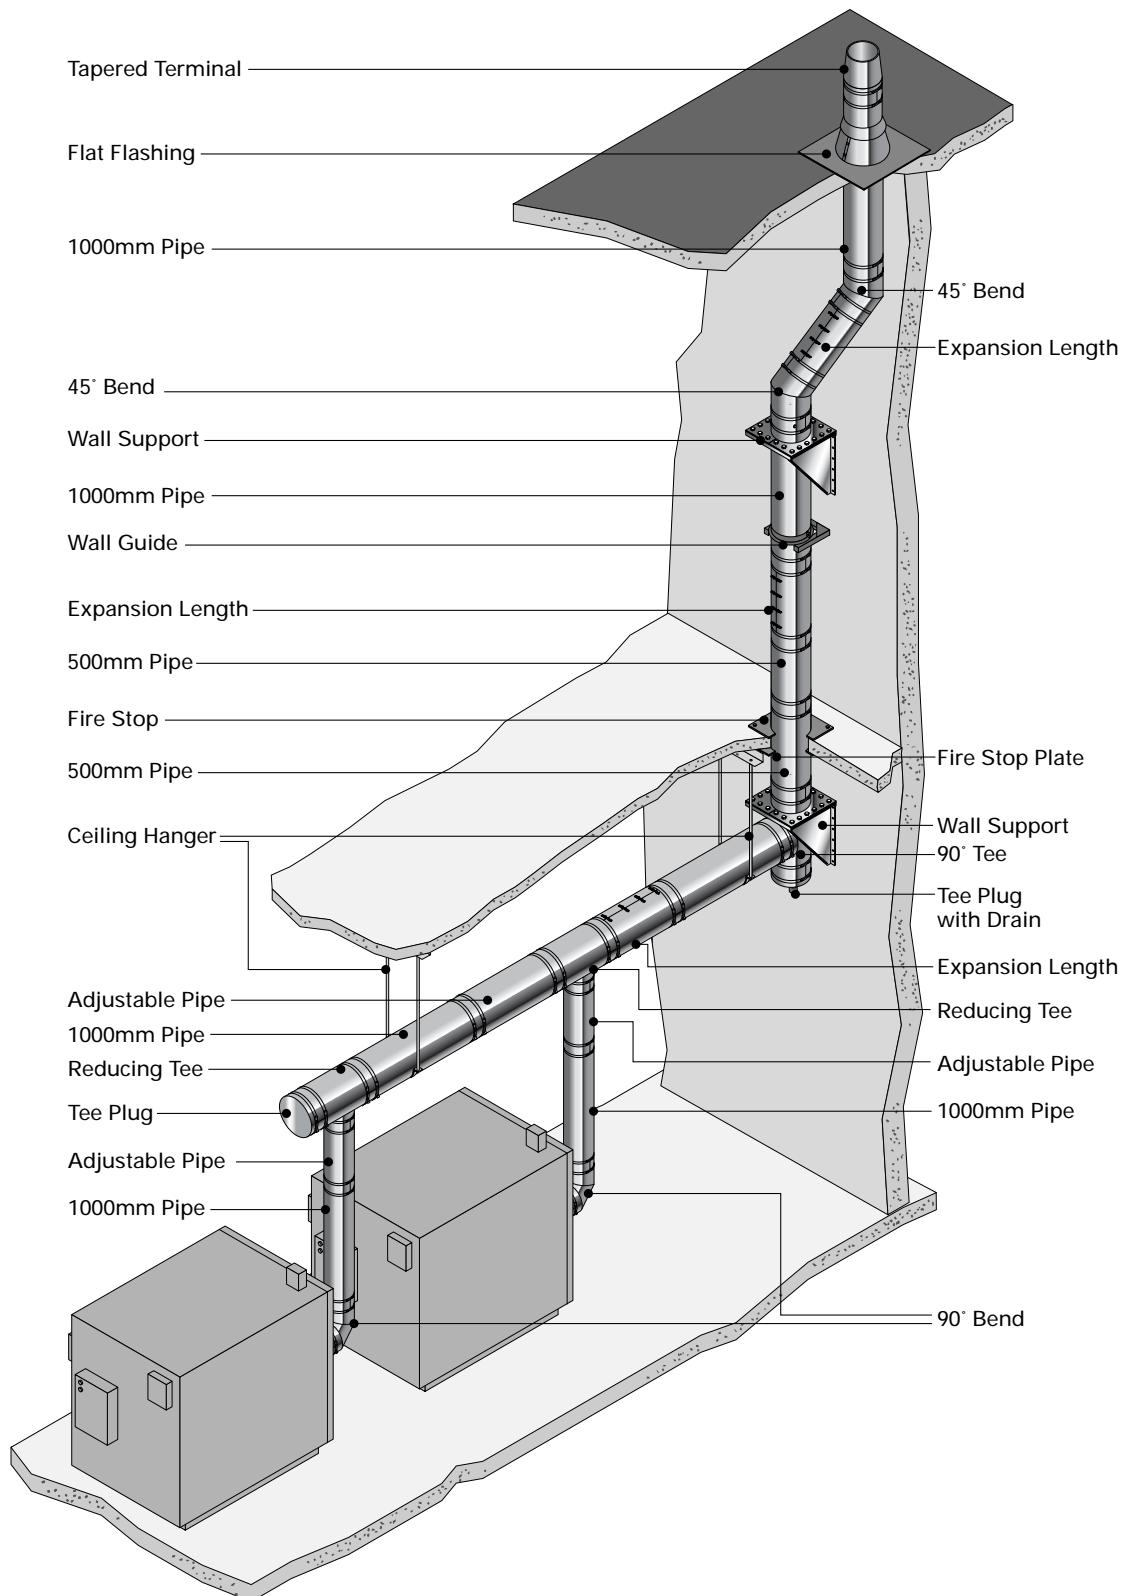

This drawing is for illustration purpose only and does not necessarily represent an actual installation.

## HP5000 Applications - Generator Exhaust

This drawing is for illustration purpose only and does not necessarily represent an actual installation.

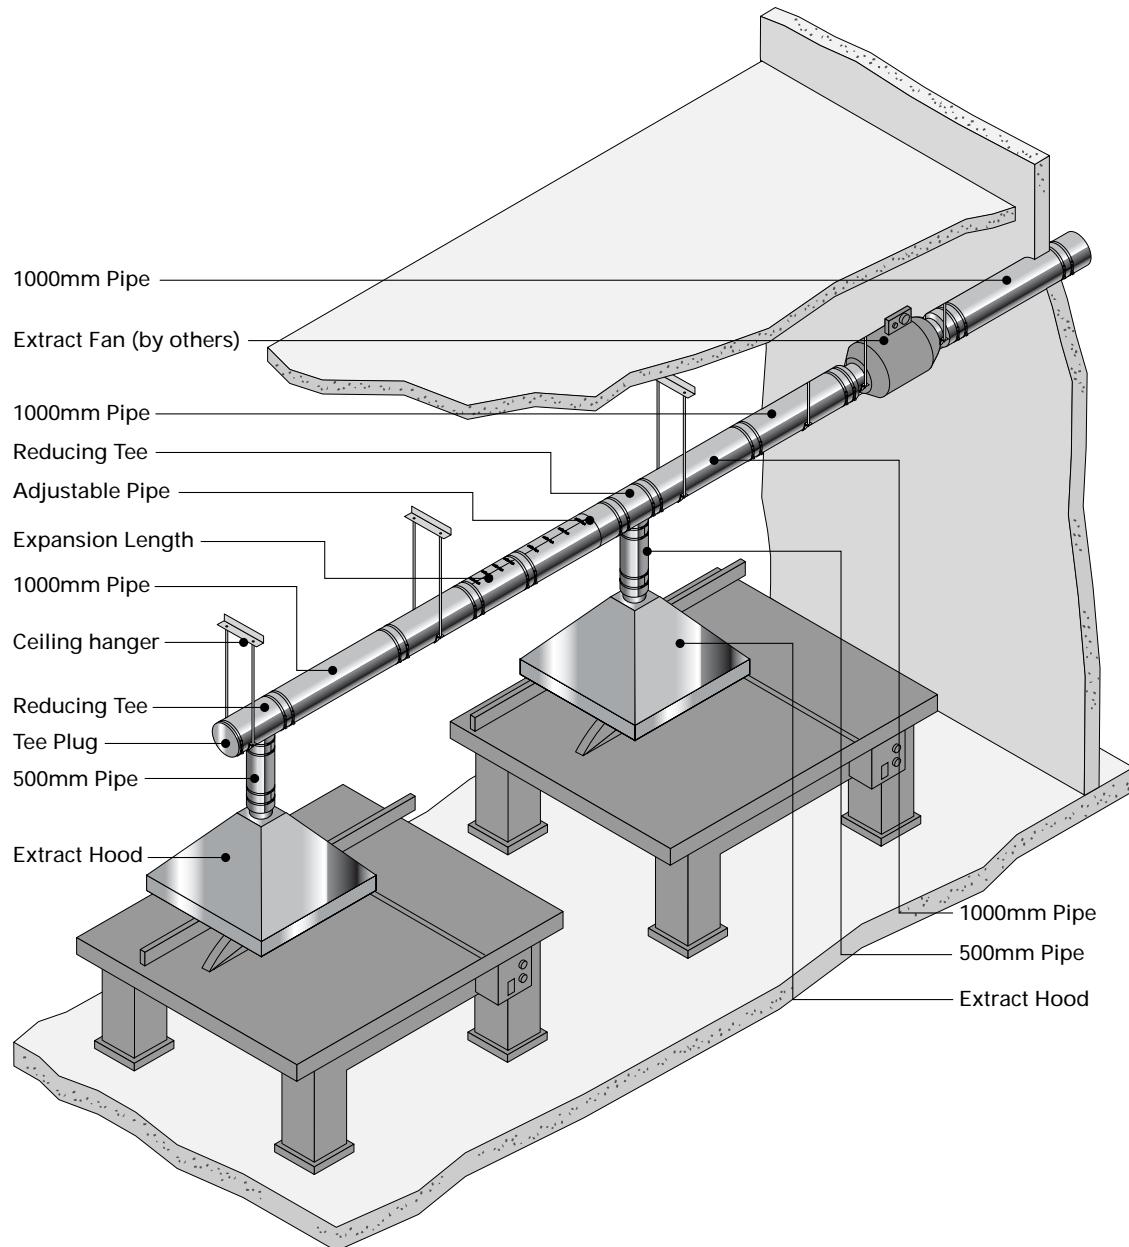

## HP5000 Applications - Boiler Exhaust

This drawing is for illustration purpose only and does not necessarily represent an actual installation.

## HP5000 Applications

### - Industrial Process/Particle Extraction/Waste Gas Extraction
